

Shopify Product Listing AI Bot

Short Implementation Procedure

1. Prepare Product Input

- Use Google Sheets as the input queue.
- Add Product ID, image URL, brand, category, and raw product information.

2. Build the n8n Workflow

- Create a workflow triggered by a new product row.
- Validate that required information and the product image are available.

3. AI Product Analysis

- Send the product image and raw information to OpenAI for analysis.
- Extract only verifiable product details. Do not allow the AI to invent specifications.

4. Generate Product Listing

- Generate the product title, description, features, tags, SEO title, meta description, and image alt text.
- Return the output in structured JSON so n8n can process each field.

5. AI Quality Check

- Use a second AI step to compare the generated listing with the original information.
- Give a quality score and identify unsupported claims or missing information.

6. Apply Approval Rule

- Score 90+ → move forward to Shopify as a draft.
- Score below 90 → send to the Human QA queue for correction.

7. Create Shopify Draft

- Connect n8n to Shopify Admin API.
- Create a draft product and populate the approved listing fields.

8. Human QA&Publishing

- QA reviews the Shopify draft.
- After approval, publish the product.

KEY TOOLS

n8n → OpenAI API → Google Sheets → Shopify Admin API → Human QA

Recommended MVP: Start with Google Sheets → n8n → OpenAI → Google Sheets. After testing accuracy, connect Shopify and create drafts. Keep human approval before publishing.
